How long does an inverter battery last?

Keep reading to learn about this subject and know the different factors that can affect your inverter battery life. In general, you should change your inverter battery in 3-5 years. From the type of battery to proper care, there are multiple factors influencing the life and optimal performance of your battery.

Do inverters need batteries?

For most residential and small commercial setups, the traditional battery and power inverter combo is the preferred choice to ensure continuous power supply during blackouts. So, while some inverter types do not require batteries, if your priority is uninterrupted backup power, investing in a quality battery in inverter system is essential.

Are inverters bad for battery life?

Incompatible inverters can cause not only a waste of energy but also damage to your battery life. Inverters that require extra power will drain your battery quicker, placing more burden on it. Simultaneously, it can cause high heat that can damage the chemical degradation of the battery.

Why do Inverter Batteries weaken?

An inverter battery weakens due to deep discharges below recommended levels, overcharging, high operating temperatures, poor maintenance (especially for lead-acid batteries), and incorrect installation. Regular maintenance, proper charging, and avoiding extreme conditions help prolong battery life.
