
Pressure Storage Solar Energy

How do solar energy systems work?

In the system they are developing, low-cost renewable electricity is used to compress air for storage during the day, while concentrated solar power feeds a thermal energy storage system. When energy demand is high, the thermal energy is used to heat the compressed air as it is released from storage to drive turbines.

Can compressed air save energy from solar panels?

As the world shifts toward renewable energy, one major challenge remains: efficient energy storage. An EU-funded research team is exploring the use of compressed air to store excess energy collected from solar panels.

How does a concentrated solar power plant work?

In conventional concentrated solar power plants, the generated thermal energy is used to heat a liquid, usually molten salts, which then acts as thermal energy storage. When power is needed, the superheat from the liquid is used to create steam and drive a turbine to generate electricity.

Are concentrated solar power plants too expensive?

However, according to Zaversky, conventional concentrated solar power plants are too expensive to be competitive against other renewables. The researchers are therefore proposing to combine the concentrated solar power technology with compressed-air energy storage, heating the compressed air with solar heat before expanding in the turbine.
