# Solar power supply control system

What is a solar power system (PCS)?

Under NEC 705.13, the PCS manages, monitors, and controls energy flows between various sources (solar, battery, and grid) to ensure safe and efficient power delivery. In a solar-only system, the PCS directs the energy generated by solar panels to:

- o The home/building loads
- o A battery storage system (if available)
- o The utility grid (excess energy)

What is control of solar energy systems?

Control of Solar Energy Systems details the main solar energy systems, problems involved with their control, and how control systems can help in increasing their efficiency. Thermal energy systems are explored in depth, as are photovoltaic generation and other solar energy applications such as solar furnaces and solar refrigeration systems.

What is a Power Control System (PCS)?

The critical role of power control systems (PCS) becomes evident as these integrated networks not only optimize energy usage from various sources, including renewable options like solar power, but also enhance reliability and ensure compliance with regulatory standards.

What is a solar power system & how does it work?

It applies to systems such as solar photovoltaics (PV) and energy storage systems (batteries), ensuring that electrical faults, overcurrent conditions, or system failures are managed effectively without jeopardizing the grid or the building's electrical system.
