# The length and width of the solar panel

What are the dimensions of standard solar panels?

Most solar panels are about 1.5 inches thick. The typical classification of solar panel sizes is based on the solar cell size, but it's not very useful for most calculations.

How long should a solar panel be?

Panels with lengths around 67.8 to 70.9 inches are more common for lower wattage models. As wattage increases, the lengths tend to extend, with panels in the 78.7 to 82.7-inch range becoming more prevalent. Some high wattage panels, particularly those exceeding 600W, can reach lengths of 93.9 inches. Width:

What are the dimensions of a SunPower solar panel?

The overall dimensions of the SunPower model are similar to those of the 60-cell panel. This is due to the manufacturer using smaller individual cells. These are the common dimensions for each: Sizes differ by brand, but never by more than an inch or two. The depth of solar panels is usually between 1.4 and 1.8-inches.

What is the typical thickness of solar panels?

Most solar panels are about 1.5 inches thick. The thickness (depth or height) is the only dimension that varies slightly among different solar panel models. The length and width of typical solar panels, along with their wattage and area or square footage, are also important factors to consider.
