What is audible substation noise?

Audible substation noise, particularly continuously radiated discrete tones (e.g., from power transformers), is the type of noise that the community may find unacceptable.

What types of noise can a substation make?

This type of noise is most likely to be subject to government regulations. Another source of audible noise in substations, particularly in extra high voltage (EHV) substations, is corona from the bus and conductors. Another type of continuously radiated noise that can be generated during normal operation is RF noise.

How does equipment design affect noise emissions at a substation property line?

Since power transformers, voltage regulators, and reactors are the primary sources of continuously radiated discrete tones in a substation, careful attention to equipment design can have a significant effect on controlling noise emissions at the substation property line.

What are the typical noise limits at a substation property line?

Typical noise limits at the substation property line used within the industry are as follows: Additional governmental noise regulations address noise levels by limiting the increase above the existing ambient to less than 10 dB. Other regulations could limit prominent discrete tones, or set specific limits by octave bands.
